Exp 5 : Semantic Network Using Python

Aim: To represent knowledge using nodes and relationships in a semantic network.

Algorithm:

1. Start the program.
2. Define concepts and their relationships.
3. Display the semantic network.
4. Stop the program.

Program:

```
semantic_network = [
    ("Student", "enrolls in", "Course"),
    ("Teacher", "teaches", "Course"),
    ("Student", "belongs to", "Department")
]

print("Semantic Network:")
for subject, relation, obj in semantic_network:
    print(subject, "-->", relation, "-->", obj)
```

INPUT: Predefined concepts and relationships.

OUTPUT:

```
>>
========== RESTART: C:/Users/Divya/Downloads/knowledge lab/exp 5.py ==========
Semantic Network:
Student --> enrolls in --> Course
Teacher --> teaches --> Course
Student --> belongs to --> Department
>>
```

RESULT:

The semantic network was successfully represented using Python
